

The 7 Layers of OSI

OSI (Open Source Interconnection) 7 Layer Model

Layer	Application/Example	Central Device/Protocols	DOD4 Model
Application (7) <small>Serves as the window for users and application processes to access the network services.</small>	End User layer Program that opens what was sent or creates what is to be sent Resource sharing • Remote file access • Remote printer access • Directory services • Network management	User Applications SMTP	Process
Presentation (6) <small>Formats the data to be presented to the Application layer. It can be viewed as the "Translator" for the network.</small>	Syntax layer encrypt & decrypt (if needed) Character code translation • Data conversion • Data compression • Data encryption • Character Set Translation	JPEG/ASCII EBDIC/TIFF/GIF PICT	
Session (5) <small>Allows session establishment between processes running on different stations.</small>	Synch & send to ports (logical ports) Session establishment, maintenance and termination • Session support - perform security, name recognition, logging, etc.	Logical Ports RPC/SQL/NFS NetBIOS names	
Transport (4) <small>Ensures that messages are delivered error-free, in sequence, and with no losses or duplications.</small>	TCP Host to Host, Flow Control Message segmentation • Message acknowledgement • Message traffic control • Session multiplexing	F I L T E R E C K E T R I N G TCP/SPX/UDP	Host to Host
Network (3) <small>Controls the operations of the subnet, deciding which physical path the data takes.</small>	Packets ("letter", contains IP address) Routing • Subnet traffic control • Frame fragmentation • Logical-physical address mapping • Subnet usage accounting	Routers IP/IPX/ICMP	
Data Link (2) <small>Provides error-free transfer of data frames from one node to another over the Physical layer.</small>	Frames ("envelopes", contains MAC address) [NIC card — Switch — NIC card] (end to end) Establishes & terminates the logical link between nodes • Frame traffic control • Frame sequencing • Frame acknowledgment • Frame delimiting • Frame error checking • Media access control	Switch Bridge WAP PPP/SLIP	
Physical (1) <small>Concerned with the transmission and reception of the unstructured raw bit stream over the physical medium.</small>	Physical structure Cables, hubs, etc. Data Encoding • Physical medium attachment • Transmission technique - Baseband or Broadband • Physical medium transmission Bits & Volts	Hub Land Based Layers	Can be used on all layers

Internet

Network

dsniff Toolkit (Layer-2 & Network Sniffing Toolkit)

4

The **dsniff** toolkit is a **collection of network auditing and penetration-testing tools** designed to **intercept, analyze, and manipulate network traffic**, primarily within **local area networks (LANs)**. It is widely referenced in **ethical hacking curricula** to demonstrate weaknesses in **unencrypted and trust-based network protocols**.

1. What is dsniff?

- A **suite of command-line tools** for **traffic sniffing, MITM, and Layer-2 attacks**
 - Commonly used on **Linux/Kali Linux**
 - Operates mainly at **OSI Layer 2 (Data Link)** and **Layer 3/4**
 - Intended for **security auditing and education** (authorized environments only)
-

2. Why dsniff is Important (Student Perspective)

- Shows how **unencrypted protocols leak credentials**
 - Demonstrates **CAM table attacks** and **ARP-based MITM**
 - Explains why **switches ≠ secure by default**
 - Reinforces the need for **encryption (TLS/HTTPS)** and **network hardening**
-

3. Key Components of the dsniff Toolkit

3.1 dsniff

- Core sniffer
- Extracts **plaintext credentials** from network traffic
- Targets protocols like:
 - FTP
 - Telnet
 - HTTP (non-TLS)
 - POP3 / IMAP / SMTP

📌 **Concept:** Sniffs traffic and prints usernames/passwords in real time.

3.2 macof

- Performs **MAC flooding (CAM table overflow)**
- Sends thousands of frames with **random source MACs**
- Forces a switch to **flood traffic** (behave like a hub)

📌 **Attack Type:** CAM Table Attack

📌 **Impact:** Enables packet sniffing on switched networks

3.3 arpspoof

- Conducts **ARP poisoning**
- Redirects traffic between victim and gateway through attacker
- Enables **Man-in-the-Middle (MITM)** attacks

📌 **Attack Type:** ARP Spoofing

📌 **Impact:** Traffic interception and manipulation

3.4 dnsspoof

- Fakes **DNS responses**
- Redirects victims to malicious or fake websites

📌 **Attack Type:** DNS Spoofing

📌 **Impact:** Phishing, credential theft

3.5 filesnarf

- Sniffs and captures files transferred over:
 - NFS
 - SMB
 - FTP

📌 **Attack Type:** Data leakage

📌 **Impact:** Unauthorized file access

3.6 mailsnarf

- Captures emails transmitted in plaintext
- Targets SMTP, POP3, IMAP (without TLS)

 **Impact:** Email confidentiality breach

3.7 msgsnarf

- Sniffs instant-messaging traffic
 - Extracts chat messages (legacy protocols)
-

4. Attacks Demonstrated Using dsniff

Attack	Tool Used	OSI Layer
MAC Flooding	macof	Layer 2
ARP Spoofing	arpspoof	Layer 2
MITM	arpspoof + dsniff	Layer 2/3
Credential Sniffing	dsniff	Layer 4
DNS Spoofing	dnsspoof	Layer 7
File Sniffing	filesnarf	Layer 7

5. Security Weaknesses Exposed by dsniff

- Trust-based LAN communication
- Plaintext protocols
- Weak switch configurations
- Lack of authentication at Layer-2

 **Key Insight:**

dsniff does not “break” encryption—it **exploits the absence of encryption**.

6. Detection & Prevention

Detection

- IDS/IPS alerts
- ARP table inconsistencies
- Duplicate MAC addresses
- Abnormal traffic flooding

Prevention

- Use **HTTPS / TLS**
 - Enable **Switch Port Security**
 - Enable **Dynamic ARP Inspection (DAI)**
 - Use **802.1X authentication**
 - Avoid plaintext protocols
-

7. Ethical & Legal Note (Very Important)

- dsniff must be used:
 - Only in **authorized lab environments**
 - With **written permission**
 - Unauthorized usage is **illegal** and punishable
-

8. Summary - The **dsniff toolkit** is a collection of **network auditing tools** used to perform sniffing, MAC flooding, ARP spoofing, and man-in-the-middle attacks in local networks. Tools such as macof overflow a switch's CAM table, while arpspoof enables traffic interception by poisoning ARP caches. dsniff demonstrates vulnerabilities in plaintext protocols and trust-based LAN communication, highlighting the importance of encryption and switch security mechanisms.

Below is a clean, exam-safe, student-appropriate list of tools used for MAC Spoofing and MAC Flooding (CAM Table Attack).
✓ Names + purpose only (no commands), suitable for notes, exams, viva, and lab theory.

Tools Used for MAC Spoofing & MAC Flooding Attacks

7:2

MAC Changer

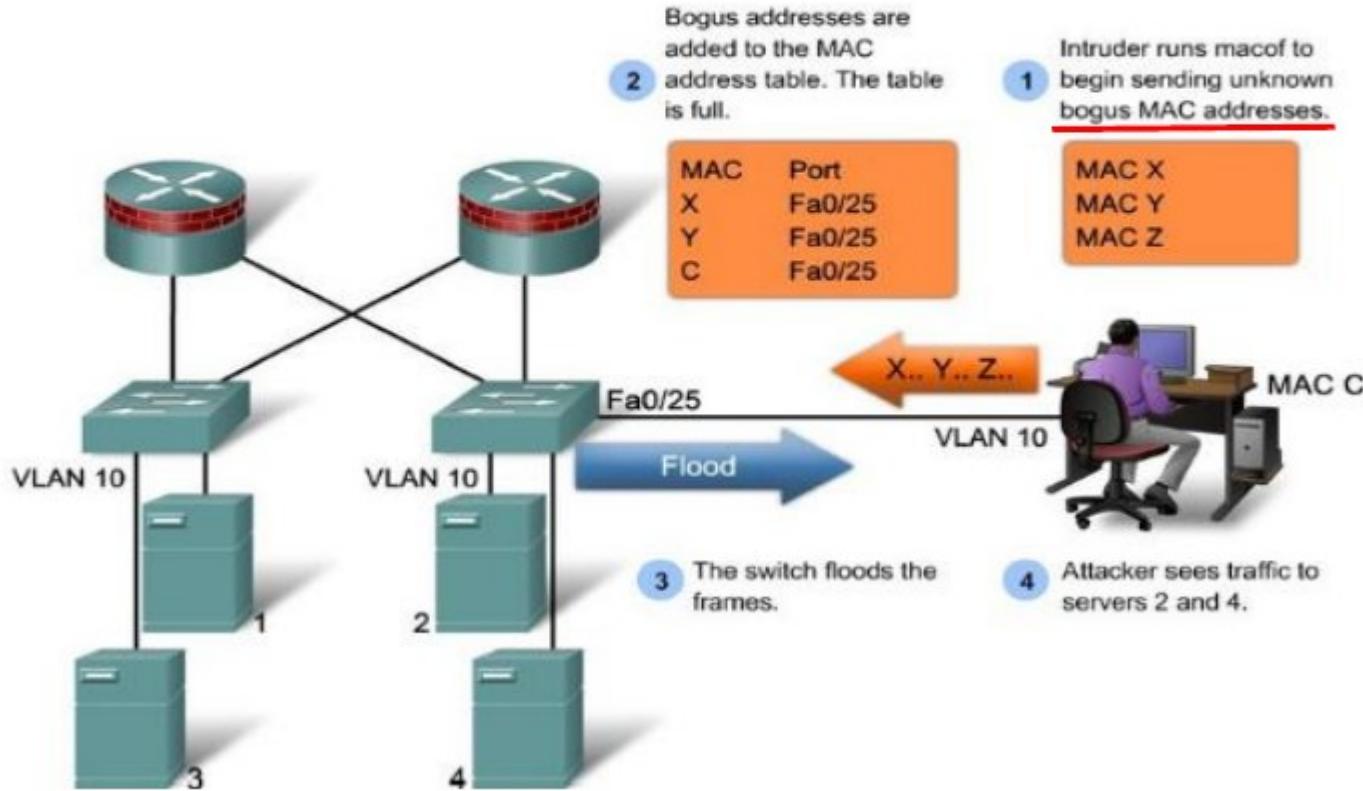

Change the MAC of any network interface.

It can be randomly generated or manually typed.

The MAC must contain 6 pair of combinations
using the charset: [0–9|a-f] something like:

00:11:22:ab:cd:ef

MAC Address Table Overflow Attack

No.	Time	Source	Destination	Protocol	Length	Info
92390	5.423927527	133.110.25.105	192.168.0.1	IPv4	54	5:c2:a8:63:8c:62 5a:e0:e4:9:4f:7e

4

1 Tools for MAC Spoofing

1. macchanger

- **Most commonly used MAC spoofing tool**
- Allows changing:
 - Random MAC address

- o Specific MAC address
- o Reset to original MAC
- Works at **Layer 2**
- Widely used in **ethical hacking labs**

📌 **Purpose:**

Impersonation, bypassing MAC filtering, privacy testing

2. ifconfig / ip (Linux utilities)

- Built-in system tools
- Can manually modify MAC address
- Useful for **demonstration and learning**

📌 **Purpose:**

Manual MAC address modification

3. NetworkManager (nmcli)

- MAC spoofing at connection level
- Often used in modern Linux systems
- Supports persistent spoofing

📌 **Purpose:**

Stealth MAC identity change

2 Tools for MAC Flooding (CAM Table Attacks)

1. macof

(Part of dsniff toolkit)

- Classic **MAC flooding tool**
- Sends thousands of frames with fake MAC addresses
- Overflows switch CAM table
- Forces switch to behave like a hub

 **Purpose:**

CAM table overflow → packet sniffing

2. Yersinia

- **Advanced Layer-2 attack framework**
- Supports attacks on:
 - CAM tables
 - ARP
 - STP
 - DHCP
- GUI + CLI based

 **Purpose:**

Educational demonstration of Layer-2 protocol attacks

3. Scapy

- Python-based packet crafting tool
- Can generate custom Ethernet frames
- Used in **research and advanced labs**

 **Purpose:**

Custom MAC flooding and spoofing simulations

3 | Tool Classification (Exam-Friendly Table)

Tool	Attack Type	Layer	Usage
macchanger	MAC Spoofing	Layer 2	Change MAC address
ifconfig / ip	MAC Spoofing	Layer 2	Manual MAC change
macof	MAC Flooding	Layer 2	CAM table overflow
Yersinia	MAC Flooding	Layer 2	Switch attack simulation
Scapy	Both	Layer 2	Packet crafting

4 | Ethical Hacking Note (Important)

- These tools are used:
 - In **controlled lab environments**
 - With **written authorization**
 - Unauthorized usage is **illegal and punishable**
-

5-Mark Exam Answer (Ready to Write)

MAC spoofing tools such as macchanger and ifconfig are used to modify a device's MAC address to impersonate another system. MAC flooding attacks are performed using tools like macof and Yersinia, which overflow the switch's CAM table with fake MAC addresses, forcing it to flood traffic. These attacks operate at Layer 2 and demonstrate weaknesses in MAC-based security.
